

## RESTORE WITHOUT THE MESS

If you've used harsh chemicals or abrasive blasting to clean and restore your masonry, you know there are challenges - damaging surrounding structures, eroding metal fixtures, removing the face of the masonry, pitting out brick, killing vegetation, and the hassle of secondary waste.

There's a better way. At Emory, we provide professional dry ice blasting that thoroughly and efficiently cleans your masonry materials, historical structures, delicate surfaces – you name it. Dry ice blasting doesn't use chemicals and there's no secondary waste to clean up afterward. Don't put off cleaning. Let us return your structure to its original state.

## DRY ICE BLASTING BENEFITS

- **Clean a variety of contaminants** including paint, adhesives, oil, grease, dirt, fire and smoke damage.
- **Easily containable** for thorough and efficient interior cleaning.
- **Enhance environmental safety** by eliminating hazardous chemicals, water, and media like sand that create messy and contaminated secondary waste.
- **Use a non-abrasive method** that won't damage the substrate, but will have your structure looking like new again.

**Dealing with fire damage?** We can help! Dry ice blasting is a safer, more efficient alternative. With no vapor, harsh chemicals, or water, Emory can remove fire and soot without harming the surface. It has even been known to reduce or eliminate the odor caused by fire and smoke.

“ For our Proven Masonry Stain to be successful, the brick has to be properly cleaned. We have used Emory and their expertise to prepare walls for us on several projects and have seen, first hand, that their process works very well. They leave the wall looking spotless, giving us the assurance that when our stain is applied, it is going to be absorbed into the brick properly. ”
